

QA Round 7

2026-05-18 · **HIGH** 1 **MED** 6 **LOW** 1 · 8 findings

Mark said all Round 6 items shipped. Round 7 verifies each one against the live portal at `dev.portal.121group.io/projects-v2/`. The headline finding is the **Edit client details modal Account Manager dropdown** — it lists exactly one option (the placeholder), so an account manager can no longer be assigned through the modal at all. Six Round-6 items are still unfixed: the sub-header chip inline-edit, the service-pill client-name prefix, the sticky letter headers, the Add contact modal layout, the Notes empty-state button, and the Project Team list layout. One new spec gap surfaces this round — the Client since date picker has no max attribute, so future dates can be entered. Two new findings + six carry-overs.

Functional · HIGH severity

1. Edit client details modal Account Manager picker is empty

HIGH **NEW**

Where to see

Open any client → click the kebab menu at the top-right of the client header card → "Edit client details..." → click the Account Manager dropdown.

Portal (today)

The Account Manager `<select>` contains one option only: the placeholder text "Choose an Account Manager...". Zero actual people in the list. The field is marked required (red *), so a client cannot be saved with an account manager assigned through this modal. Probed live on the Acme Corp (For Internal Testing) client.

Original (source build)

The same dropdown lists the placeholder plus seven people (Nikko Trinidad, Kate Chen, Marcus Aldrin, Diana Reyes, Jordan Park, Kate Lawrence, Nikko Trinidad). Side note: the original also has a duplicate entry ("Nikko Trinidad" twice) — that's a separate pre-existing dedup bug worth fixing at the same time.

How to ship

The filter is most likely still checking against the legacy 'editor' role string. In the new 4-tier RBAC the editor tier was renamed to "Member" and 'editor' no longer exists in the role enum, so the filter matches nobody. Update the filter to include anyone with edit privileges — `accessLevel` in ('owner', 'admin', 'member'), exclude Viewers. While you're in there, dedupe the list by member id at render time so the duplicates don't surface either.

Functional · MED severity

2. Sub-header chips (Industry / Manager / Client since) are inline-editable on portal

MED FROM PREVIOUS QA

Where to see

On any client's detail page, look at the three chips directly under the company name: *Retail* ×, *Manager: None assigned* ×, *Client since May 2026* ×. Click any of them.

Portal (today)

Clicking the chip turns it into an inline editor — the Client since chip becomes a `<input type="date">` field, the Manager chip becomes a `<select>`. Each chip also carries an × button that clears the value directly. The portal exposes two parallel ways to edit the same fields: inline on the chip, and via the Edit client details modal (kebab menu → Edit). Both paths exist; both must be maintained.

Original (source build)

The same fields render as display-only labels (*Healthcare / Wellness* · *MANAGER: KC Kate Chen* · *CLIENT SINCE Feb 2025*). No × buttons, no inline editor. The only way to edit these fields is through the Edit client details modal — single source of truth.

How to ship

Drop the inline-edit affordances and the × clear buttons. Make the chips display-only. Route every edit through the existing Edit client details modal that the portal already has. Two consequences: (a) the × clear behaviour goes away, but those fields are required on the original anyway so clearing-to-empty shouldn't be a supported state; (b) you remove the divergence between the two edit paths and the maintenance cost of keeping both in sync.

3. Client since date picker accepts future dates (no max attribute)

MED NEW

Where to see

Click the Client since chip on the client header, or open the Edit client details modal → Client since field. The native date picker appears.

Portal (today)

The `<input type="date">` has neither `min` nor `max` set (both attributes return empty strings on probe). You can pick 2099 and save. The chip then renders "Client since May 2099" — garbage data with no validation guard.

Original (source build)

Same spec gap — the source build also has no `max` set, so this isn't a portal-only regression. Calling it out here because the rule belongs in both codebases.

How to ship

Add `max={todayISOString() }` to the Client since date input on both the portal and the original. Apply the same fix on the inline chip-as-editor and on the modal field. Worth a peer sweep for any other date inputs (service start date, card due dates) where a future-date guard would also make sense.

Cosmetic · MED severity

4. Service pill labels still carry the `clientName` - prefix in the sidebar

MED FROM PREVIOUS QA

Where to see

Look at any client row in the clients sidebar. Below the client name sits a row of service pills.

Portal (today)

Each service pill renders as `clientName` - `serviceName` — examples from the Atlas Paving row: "Atlas Paving - April 2026 Retainer", "Atlas Paving - Development - Block 10", "Atlas Paving - March 2026 Retainer". The client name takes roughly half the visible pill width, so the service name truncates much earlier than necessary.

Original (source build)

Service pills render just the service name — "Reputation Rebuild", "Local SEO & Reviews", "Patient Acquisition". No client-name prefix. The client name appears once on the row above and isn't repeated on every pill.

How to ship

Strip the `client.name` - prefix from the displayed pill text. The underlying data probably stores `client.name` - `service.name` as the service name itself (a legacy import quirk) — if so, the cleanest fix is to derive the display string at render time so the underlying record isn't rewritten. The trailing IDs were stripped in Round 6; the prefix is the last piece.

5. Sticky letter headers (A, B, C...) missing in clients sidebar

MED FROM PREVIOUS QA

Where to see

Open the Clients page and scroll the sidebar.

Portal (today)

Clients are sorted alphabetically (the sort shipped in Round 6) but there are no letter dividers between buckets. The sidebar jumps from "121 Group" straight into "Acme", "Atlas", "Belle", "Berg", "BidsOnline" with nothing to anchor the eye.

Original (source build)

A capital-letter heading sits at the top of each alphabetical bucket — **A** before Acme + Apex + Atlas, **B** before Basalt + Beacon, **C** before the next group, and so on. The heading stays pinned to the top of the sidebar as you scroll past its bucket (sticky position).

How to ship

Group the sorted client list by `client.name[0].toUpperCase()` and render a sticky `<li class="clients-list-letter">` divider above each bucket. CSS for `.clients-list-letter` already lives in the source build's `flizow.css` from the Round 6 fix — port that selector across. For the one client that starts with a number ("121 Group"), either bucket under a `#` heading or merge with the **A** bucket.

6. Add contact modal still deviates from the original build (seven differences)

MED **FROM PREVIOUS QA**

Where to see

Open any client → About tab → Client Contacts section → click "+ Add contact".

Portal (today)

The modal is missing the × close button in the header, uses placeholder-only inputs (no labels above), names the fields "Full name" / "Position / Role" / "Email address" / "Mobile number (optional)", stacks every field full-width vertically, omits the primary-contact helper text, and renders anchored to the upper half of the viewport rather than centered.

Original (source build)

Modal has the × close button in the header. Each input has a label above ("Name", "Role", "Email", "Phone"). Email and Phone share a single row at 50/50 width. The "Set as primary contact" checkbox shows helper text underneath ("Replaces James Oduya as primary.") when toggling will displace the current primary. Modal is centered. Title carries a person-plus icon.

How to ship

Match the original modal end to end. Specific items:

1. Add the × close button in the modal header.
2. Render visible labels above each input; demote current placeholders to example text ("e.g. Jamie Chen").
3. Rename fields: "Full name" → "Name"; "Position / Role" → "Role"; "Email address" → "Email"; "Mobile number (optional)" → "Phone".
4. Lay Email + Phone in a single 50/50 row.
5. Add helper text under the primary-contact checkbox showing who will be replaced.
6. Centre the modal in the viewport.
7. Add the person-plus icon to the title.

7. Project Team list is vertical on portal; original lays out horizontally

MED **NEW**

Where to see

Open any client with multiple operators (e.g. 121 Group, For Internal Testing) → About tab → scroll to the Team panel → Project Team section.

Portal (today)

Each project-team member renders as a full-width stacked row — avatar on the left, name + role on the right, one member per row. With 17 operators on the 121 Group client, the list runs 17 rows tall and the Team panel dwarfs everything else on the About tab.

Original (source build)

Project-team members render in a horizontal row layout. The container is team-group-row with `display: flex; flex-direction: row` (probed live via computed style). Members flow left-to-right and wrap as the container fills, so a 17-operator team takes 3–4 lines instead of 17.

How to ship

Match the original's team-group-row pattern — `display: flex; flex-direction: row; flex-wrap: wrap; gap: 12px` (or whatever the design token is). Each member card becomes a fixed-width tile that flows. The Account Manager row above stays as a single full-width card; only the Project Team grid switches to horizontal flow.

Cosmetic · LOW severity

8. Notes empty-state "+ New note" button is oversized on portal

LOW FROM PREVIOUS QA

Where to see

Open any client that has no notes (e.g. Acme Corp For Internal Testing) → Notes tab → look at the centred empty state.

Portal (today)

The "+ New note" button in the empty state is rendered at roughly 1.5–2× the height and padding of the original's button. The headline ("No notes yet"), subtitle ("Add your first note to start."), and pencil icon all match; only the button is overweight. The empty-state side rail also stays blank below the search input.

Original (source build)

The "+ New note" empty-state button matches the standard primary-button height used elsewhere in the app (around 36 pixels tall). The empty-state side rail shows a small helper line under the search input ("No notes yet. Press New note to start one.").

How to ship

Match the standard primary-button height on the empty-state CTA — same class as the "+ Add client" / "+ Add service" buttons used elsewhere. Add the small helper line under the rail's search input.

Where we stand · what to prioritize

Round 6 to Round 7 progress. Mark shipped the alphabetical sort on the clients sidebar, the trailing service-ID strip, and the "Restore client" rename. Those landed cleanly. What's outstanding is six items from Round 6 that didn't get touched (the sub-header chip inline-edit, the service pill client-name prefix, the sticky letter headers, the Add contact modal, the Notes empty-state button, and the Project Team layout), plus two newly surfaced findings (the Edit-modal Account Manager dropdown returning zero options, and the Client since date picker accepting future dates).

What to prioritize. The only true blocker right now is finding 1 — the empty Account Manager dropdown. A new client cannot be saved without an account manager assigned, so it breaks the new-client workflow for anyone using the Edit modal. We'd recommend Mark patches that first, then sweeps the six carry-overs in a single pass because most are scoped to the same client-detail surface, then ships the date-picker guard and Notes-button polish as the closing tidy-up. None of items 2–8 block launch — they're polish and consistency work that improve agency-side credibility but don't stop the tool from being used.
