

How to Run a Weekly WIP

A guide for AMs running the standing meeting in Flizow. Skim the Quick Start if you already know the page. Read the rest the first time you walk through it.

What Weekly WIP is for

Weekly WIP is the standing-meeting page in Flizow. It pulls live data from your clients, services, and tasks, then auto-builds an agenda before you walk in. You add the human stuff (manual items, context), send a pre-read, run the meeting from a stage view, and capture notes, decisions, and actions in real time.

The whole point: stop retyping the agenda every week. The data is already in Flizow. The meeting page assembles it for you so you can focus on running the room.

Quick Start (5 steps)

- 1. Open Weekly WIP from the top nav.
- 2. Look at the auto-built agenda. Add manual items if you have something specific to bring up.
- 3. Click Send pre-read. Copy the body, paste it into Slack or email. Send it 15 to 30 minutes before the meeting.
- 4. Click Start meeting when everyone is on the call.
- 5. Walk top to bottom through the items. Capture notes, decisions, actions as they come up. Click End meeting when done.

The Agenda tab

The agenda groups items into four buckets, in this order:

- **New clients:** clients added since last week.
- **Urgent:** anything blocked, critical, overdue, or in review.
- **On track:** what is worth celebrating or nudging forward.
- **Manual:** items you added by hand.

Each group is auto-built from your live data. You do not enter most of this. The system reads what is in your boards and assembles it.

Adding manual items

Click Add agenda item. You can give it a title, tag it to a client (optional), and add a short context note that shows up in the pre-read. Use this for the things the data will not catch: a leadership

decision, a heads-up to the team, a personnel update.

Removing items

Click the X next to any item to drop it from this week's agenda. The row in the underlying store stays put. You are only hiding it from this specific meeting.

The Pre-read

Before the meeting, click Send pre-read. A modal opens with two parts:

- **Subject line:** auto-filled with today's date.
- **Body:** compiled from your agenda, in plain text.

You have two buttons:

- **Copy to clipboard:** paste into Slack or any chat tool.
- **Open in email:** opens your default mail app with the subject and body pre-filled.

Flizow does not actually send anything. The team's email addresses live in your tools, not here. The pre-read is content you copy into wherever you communicate.

When to send: 15 to 30 minutes before the meeting. Long enough for people to skim, short enough that they do not forget by the time the call starts.

Running the meeting (Live tab)

When you click Start meeting, three things happen:

- 1. The Live tab activates.
- 2. The first agenda item lands on the stage.
- 3. A wall clock and a per-item timer start running.

You walk the room through each item one by one. The stage shows the item title, the context, and quick links to the related client or kanban card.

Keyboard shortcuts

These are the ones worth memorizing:

- **Right arrow** or **J**: next item.
- **Left arrow** or **K**: previous item.
- **Space**: mark the current item as done.
- **N**: open a Note composer.
- **D**: open a Decision composer.
- **A**: open an Action composer.

- **O**: open the focused item's client profile in a new tab.
- **C**: open the focused item's kanban card in a new tab.
- **Esc**: end the meeting (with a confirm).

Quick Capture (N, D, A) is what makes the live meeting useful. Do not try to remember everything and write it up after. Type as you go.

Quick Capture types

Three types, three different jobs:

- **Note**: context, observations, things said in the room.
- **Decision**: anything the team decided, including the people involved.
- **Action**: a follow-up someone owes, ideally with a name attached.

Each capture is timestamped and tagged to the agenda item that was on the stage when you typed it. The full log shows up in the Live tab as the meeting runs.

Jumping around

Sometimes the room veers. Click any item in the agenda strip on the right rail to jump to it. The per-item timer resets to that moment so the new item gets a fresh count.

Ending the meeting

Click End meeting, or hit Esc. A confirm dialog asks if you are sure. Click End meeting again to actually finish.

What survives:

- All the captures you typed (notes, decisions, actions) stay in the store.
- The agenda for next week rebuilds automatically from current data.

What gets wiped:

- The current item pointer.
- The per-item timer.
- The done flags.

This is by design. Captures are the meeting product. The in-flight UI state is just the cursor for that one meeting.

FAQ

Why does the agenda look different every week?

Because it is built from live data, not a saved template. If a client closed a critical task this week, the urgent group is shorter. If you added a client, the new-clients group reflects it. The data drives the agenda, not the other way around.

Can I rearrange the agenda?

Not yet. Drag-and-drop reordering is on the roadmap. For now, the four groups are fixed in order (New clients, Urgent, On track, Manual) and items inside each group are sequenced by the system.

What if my meeting runs over?

The wall clock and per-item timers do not stop you. They show you where time went. If items keep getting cut off, drop the lowest-priority manual items before the meeting starts, or split the meeting into two shorter sessions next week.

Where do action items go after the meeting?

They sit in the meeting captures log. Right now they are not auto-promoted to actual ActionItem records on a client profile. Raise it with the dev team if that becomes a friction point. It is on the list of things to ship next.

Can two AMs run a meeting together?

Yes. Both can have the Live tab open at the same time. Quick Capture writes to the same store, so notes typed in one tab show up in the other within a second or two.

What is the difference between Weekly WIP and the Ops board?

Ops is for internal team work: capacity, time-off, agency-side tasks. Weekly WIP is the client-facing meeting agenda. What is happening with the work you have sold. Different audience, different page.

What if I close the tab mid-meeting?

Captures already typed are saved. The in-flight meeting state (current item, per-item timer, done flags) is wiped because it lives in memory, not the store. Reopen Weekly WIP and click Start meeting again to resume from the top.
